

Technical Summary

Revised Structural Steel Standards

August 2016

Structural Steel

This summary covers changes to standards: AS/NZS 3678, AS/NZS 3679.1 and AS/NZS 3679.2 (released April 2016; replacing the 2010 (AS/NZS 3679.1 and .2) and 2011 (AS/NZS 3678) versions). Some changes are common across all three standards and some changes are specific to AS/NZS 3678 only (as described below).

Common changes

What has changed?	Why has it changed?
Identification Requirements <ul style="list-style-type: none">• Dimensions as a mandatory requirement of the label.• Strengthening of requirements regarding the stencilling.	Improved identification and traceability of the product: <ul style="list-style-type: none">• Assists QA through the supply chain• Reduces the risks posed by unmarked steel• Ensures traceability back to the original test certificate.
Test and Inspection Certificates <p>Test certificates must</p> <ul style="list-style-type: none">• Be available for all product• Must be an original or a copy without alteration (except to delivery quantity)• Copies of test certificates must ensure traceability of the product and that the original manufacturers test certificate must be available on request.	<ul style="list-style-type: none">• Reduce the risk of material not meeting the specified property requirements, particularly where customers are not familiar with material specifications.• Avoid sourcing from diverted non-compliant material.
Type Testing and Minimum Testing and Inspection Requirements <ul style="list-style-type: none">• Minimum sampling, testing and inspection requirements for both new products (type testing) and established products.	Type testing: <ul style="list-style-type: none">• Ensures that material supplied is properly designed to meet the specific requirements of AS/NZS 3678.• Limits the supply of substitute or alternative material that has not undergone type testing.• Aligns with ATIC 10 requirements Minimum production testing and inspection requirements ensures that: <ul style="list-style-type: none">• That the material supplied complies with the standard. This has not always been the case with imported material
Factory Production Control (FPC) <ul style="list-style-type: none">• New mandatory requirement of all three standards.	<ul style="list-style-type: none">• FPC aims to ensure the manufacturer has a robust manufacturing system that ensures products conform to the standard.• FPC also reduces the variability in material properties supplied.

Changes specific to AS/NZS 3678

What has changed?	Why has it changed?
<p>Steelmaking Requirements</p> <ul style="list-style-type: none"> • Lower Sulphur limits included for Z25 and Z35 grades (Clause 6, Table 1) • Internal soundness clause added (Clause 8.5 and Appendix A3) • Requirement for Boron to be reported on Test Certificates • Boron should not be deliberately added to steels covered in AS/NZS 3678 	<ul style="list-style-type: none"> • Guidance included to ensure that ultrasonic testing requirements are considered at time of purchase • Material supplied, where the test certificate does not report Boron, is NOT compliant to AS/NZS 3678:2016 • Recognition that Boron can potentially reduce the weldability of structural steels if not taken into consideration when designing the welded joint • If Boron levels are >0.0008% proof of suitability for welding and thermal cutting should be requested.
<p>Extended Grade Availability</p> <ul style="list-style-type: none"> • WR350 thickness range extended to 80mm, from the previous limit of 20mm. • Introduced an “L20” option for WR350 grades. • Through thickness tensile tested grades down to 12mm • Mechanically tested grades up to 200mm thick for strength levels up to and including 350 grade. • L0 impact tested grades reintroduced to the standard • Product with no impact test requirement (previously listed as “None”) in Table 10 of AS/NZS 3678 has been removed from the AS/NZS 3678 standard. 	<p>All the changes listed increase the range of products that are covered by the standard. This gives engineers greater guidance in specifying and checking compliance of materials.</p> <ul style="list-style-type: none"> • Increasing the thickness range of WR350, enables it to be used for structural applications such as bridges. • Weathering resistant steels provide advantages in terms of corrosion resistance in certain environments and applications that can reduce overall costs. • “L0” is a commonly specified grade referenced in design codes. • The inclusion of “L0” grades removes the disconnect between AS/NZS 3678 and AS 4100 that was previously the case.
<p>Option for Zinc Coating Classification</p> <p>Classifies steel with respect to Silicon (and phosphorus) levels and the impact of Silicon levels on the thickness and appearance of the galvanized layer.</p>	<p>Provides clarity for customers when purchasing steel when galvanizing is a consideration.</p>
